The artist is a collector. Not a hoarder, mind you, there's a difference: Hoarders collect indiscriminately, artists collect selectively. They only collect things that they really love.

The diagram illustrates a linked list structure. It consists of two nodes, each represented by a horizontal rectangle. The left half of each rectangle contains a small square icon with a document symbol. The right half contains a pointer to the next node. The first node's pointer points to the second node, indicating the sequence of the list.

Diagram illustrating data storage or memory layout:

- Top row: 10 boxes, followed by the number 100, followed by 5 boxes, followed by the number 1000, followed by 15 boxes.
- Bottom row: 15 boxes.

1. 2019年10月，某市发生了一起重大交通事故，造成多人伤亡。事故发生后，市政府立即启动应急预案，组织相关部门进行救援和调查。

1. 2019年，我国GDP总量为99.0865万亿元，比上年增长2.3%。其中，第一产业增加值7.0465万亿元，比上年增长3.2%；第二产业增加值43.9865万亿元，比上年增长1.6%；第三产业增加值48.0535万亿元，比上年增长3.1%。

2. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

3. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

4. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

5. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

6. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

7. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

8. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

9. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

10. 2019年，我国人均GDP为7244美元，比上年增长1.2%。其中，第一产业人均增加值1000美元，比上年增长2.1%；第二产业人均增加值3500美元，比上年增长0.8%；第三产业人均增加值2744美元，比上年增长1.5%。

The diagram illustrates a sequence of 40 small squares arranged in four rows of ten. The first row is solid black. The second row contains the first 10 squares of the first row, followed by two double-headed arrows, and then the next 10 squares of the first row. The third row contains the first 10 squares of the second row, followed by two double-headed arrows, and then the next 10 squares of the second row. The fourth row contains the first 10 squares of the third row, followed by two double-headed arrows, and then the next 10 squares of the third row. Below the fourth row, there are two groups of four squares each, separated by a double-headed arrow.

Diagram illustrating a sequence of memory blocks or data structures, enclosed in double asterisks (**).

The sequence consists of the following blocks:

- A block of 4 cells.
- A block of 2 cells, enclosed in double quotes (").
- A block of 10 cells, enclosed in double quotes (").
- A block of 8 cells, enclosed in double quotes (").
- A block of 4 cells, enclosed in double quotes (").

[illegible]

The diagram illustrates a 3D array structure. It consists of three rows of blocks. The top row contains three blocks, each with 10 cells (5 columns by 2 rows), separated by double asterisks (**). The middle row contains three blocks, each with 10 cells (5 columns by 2 rows), separated by double asterisks (**). The bottom row contains one block with 10 cells (5 columns by 2 rows), preceded by double asterisks (**).

[illegible][illegible][illegible]

A diagram consisting of 16 small squares arranged horizontally, followed by two pairs of double quotation marks.

The diagram illustrates the structure of a C string. The top row shows a sequence of 26 boxes representing the alphabet 'A' through 'Z', followed by a greater-than sign (>) and another sequence of 6 boxes. The bottom row shows a sequence of 8 boxes, followed by a double quote (\"), a sequence of 2 boxes, another double quote (\"), a sequence of 8 boxes, two asterisks (**), a sequence of 8 boxes, another double quote (\"), a sequence of 4 boxes, another double quote (\"), two asterisks (**), and a final box.

The diagram illustrates a linked list structure. It consists of two nodes, each represented by a rectangle divided into two sections. The left section of each node contains a vertical stack of 10 small squares, representing the data stored in the node. The right section contains two asterisks (**), representing a pointer to the next node in the sequence. The first node's pointer points to the second node, indicating the flow of the list.

“You can’t connect the dots looking forward, you can only connect them looking backwards.” “”
—Steve Jobs—

“Be regular and orderly in your life, so that you may be violent and original in your work.” “” —
Gustave Flaubert

Your job is to collect good ideas. The more good ideas you collect, the more you can choose from to be influenced by.

The Internet can be more than just a resting place to publish your finished ideas—it can also be an incubator for ideas that aren't fully formed, a birthing center for developing work that you haven't started yet.

“Be regular and orderly in your life, so that you may be violent and original in your work.”
—Gustave Flaubert
—

6.Stay open and pay attention to the emerging logic of your choices, thinking about what connects the work and words you are writing.6.

Over time, your collaging will develop into an internal through-line or logic. This through-line/logic could be anything—a theoretical idea; a repeated experience or way of describing an experience; a recurring character, object, feeling, space, or place. Use this through-line/logic as you continue to develop your writing project.

— —

Any stream-of-consciousness, free-writing exercise can help us move inside-out and back again

I knew what I needed to make to cover my business and my life, so I could decide to slow down when I reached “enough” as well.

“ ”

as a diagnosis in the 11th Revision of the World Health Organization's International Classification of Diseases. Based on confirmatory factor analysis studies with adults [12] the ICD-11 diagnosis of cPTSD is defined operationally as requiring one of the two symptoms from each of three DSM-IV criteria for PTSD (i.e., intrusive re-experiencing, avoidance of trauma reminders, hyper-arousal) and one of the two symptoms from each of three domains of Disturbances of Self-Organization (DSO). The cPTSD/DSO symptoms represent post-traumatic: (1) emotional numbing and dysregulation,

cPTSD/DSO (1) (2) self-perceptions as a failure or worthless, and (3) emotional detachment in relationships. 3

involves chronic instability in self-liking when distressed and chronic emotional numbing, but not the emotional lability, extreme uncontrolled anger, and profound emotional dyscontrol found in BPD. Negative self-perceptions in cPTSD/DSO tend to center on a stable chronic sense of guilt, shame, and worthlessness, in contrast to the more unstable and fragmented sense of self in BPD. Although both cPTSD and BPD involve severe relational problems, this involves intense volatile relational hostility and alternating enmeshment and disengagement to avoid real or imagined

characterized by avoidance and detachment based a fear of closeness[18].

[190]

DSO

the three DSO domains (i.e., emotion dysregulation, negative self-perception, impaired relationships)

cPTSD DSO
PTSD cPTSD/BPD

Years later, I decided (one fateful day on my analyst's couch) to write a paper which applied Self Psychology to the creative process.

airport vehicle, the hanging out at the party vehicle. The point I'm making is that there are many dimensions to us as we go through our lives. It's even a good idea to spend a little time improving some of these vehicles. But one point I'm not making is to be phony, to put on an act, to, as we say in the music business, "shuck and jive." If we stop trying to look a certain way, make an impression, try to communicate, and if we simply "relax into ourselves" and then do nothing, absolutely nothing, something real can begin to happen. And all of the vehicles you have available to you as you create your life have one thing in common: they are all yours. So if you do this, better

During that period, I made 3 observations that set the principles with which I was to work for the next 25 years (and counting.) They are: 1. Energy moves where it is easiest for it to go—Energy takes the path of least resistance. 2. The underlying structure determines this path. 3. You can change the underlying structure, thereby changing the path of least resistance.

1. Energy moves where it is easiest for it to go—Energy takes the path of least resistance. 2. The underlying structure determines this path. 3. You can change the underlying structure, thereby changing the path of least resistance.

To address structural change, we need to build a system that can reinforce the goals and actions people take, build competency over time, increase organizational and systemic learning, bring out the best in people, and create momentum.

And when that happens, just remember, it's not the logistics that create a simple life. It is clarity, a sense of direction, and the true expression of your spirit. Each one clears away the fog. Each one builds on the other. So, simplify, simplify, simplify.

But that brings us to an interesting thought. In one way or another we all need to learn how to be self-made, no matter what our background, advantaged or disadvantaged. Part of the maturation process is to learn how to create ourselves, and recreate ourselves as we grow with age and experience. If we read biographies, which I do voraciously, we find that the protagonist of every book has found a way to create, and then recreate him or herself.

Twyla Tharp is one of the great choreographers and artists of her generation, and she understands the creative process from the inside-out. One of her major themes as she describes it is, "Creativity is a habit, and the best creativity is a result of good work habits. That's it in a nutshell."

in some form of limbo, not able to go forward and not able to go back. In some sense, all of us live in a state of limitation.

For some of us it is physical, for others, economic, for others, internal limitations that seem to rob us of our human spirit. Yet, as we see dramatized in The Terminal, it is through the creative expression of the human spirit that the limitations we have become simply part of the raw material we can use to build our lives.

What is the place of feelings in the creative process and in life?

.....
.....

1880453

“Instead of thoughts of concrete things
patiently following one another . . . we
have . . . the most unheard of combination
of elements, the subtlest associations of
analogy . . . a seething cauldron of
ideas, where everything is fizzling and
bobbling about in a state of
bewildering activity” (James, 1880, p. 453).

all creativity involves making connections
between disparate ideas that seemed
to have no connection with one another.

That is, to be creative, one lets ideas and feelings percolate up from the deeper parts of one's mind.

In order to get the results we desire, we must do two things. We must first create the space to reason in our thoughts, feelings, and actions; and second, we must deliberately use that space to think clearly.

It's safe to assume that anything useful in this book is someone else's idea, and that my main contribu-tion is to put the mosaic of what I've learned from others who came before me out there for the world.

Never forget that your unconscious 
is smarter than you, faster than you,
and more powerful than you. It may even
control you. You will never know all of its
secrets. 
— CORDELIA FINE, — 

So our first step in improving our outcomes
is to train our-selves to identify the
moments when judgment is called for in
the first place, and pause to create space
to think clearly.

Individualist definition: Creativity is a new mental combination that is expressed in the world.

Creativity is a combination. All thoughts and concepts are combinations of existing thoughts and concepts. The mind is an immense web of symbolic material; most of it has been previously mastered, and simply recalling from memory isn't creative. Creativity involves a combination of two or more thoughts or concepts that have never been combined before by that individual.

they can't see. This is why the scientific definition of creativity has to exclude ideas that stay in a person's head and are never expressed, and ideas that no one else can see or understand. Under this definition, your nightly dreams aren't creative; ideas that you have but never write down or communicate to anyone else aren't creative. Creativity lives and breathes in the world, in the objects we can see and touch, in the ideas we express and share, and in the process, products, or artifacts we create.

Sociocultural definition: Creativity is the generation of a product that is judged to be novel and also to be appropriate, useful, or valuable by a suitably knowledgeable social group.

Most business scholars distinguish between “creativity” as the ideas or products generated by individuals, and “innovation” as the successful execution of a new product or service by an entire organization (Sawyer & Bunderson, 2013).

[illegible]

People Are More Creative When They're
Alone

Creativity is a Personality Trait

Creativity is a Healing, Life-Affirming
Activity

Creative activities are the fullest realization of human experience. They express the inner being of the person, and result in great personal fulfillment. Creative activities contribute to psychological health; this is why art therapy and music therapy are effective.

As Morris Stein wrote at the time, “To be capable of [creative insights], the individual requires freedom—freedom to explore, freedom to be himself, freedom to entertain ideas no matter how wild and to express that which is within him without fear of censure or concern about evaluation”

“Creative activities are the fullest realization of human experience. They express the inner being of the person, and result in great personal fulfillment. Creative activities contribute to psychological health; this is why art therapy and music therapy are effective.”

Creativity as Self-Discovery

creators to share the widespread cultural beliefs typical of their cultures. American composer Aaron Copland said that “each added work brings with it an element of self- discovery. I must create in order to know myself, and since self-knowledge is a never-ending search, each new work is only a part-answer to the question ‘Who am I?’ and brings with it the need to go on to other and different part-answers” (Copland, 1952, p. 41). Artists with this conception of creativity often speak of the courage required to pursue creative activity (an idea closely associated with existentialist

philosophy). Copland “discovered himself through his music” (Copland, 1952, p. 41). In a 1959 interview, Copland (1959) said that “the creative process is a search for self-knowledge. It is a process of discovery, and it is a process that requires courage.”

European cultures place a high value on the fine arts—those creative products that have no function other than pleasure. Craft objects are seen as less worthy; because they serve an everyday function, they're not purely creative.

One of the most obvious differences between intelligence and creativity is that intelligence requires convergent thinking, coming up with a single right answer, while creativity requires divergent thinking, coming up with many potential answers.

• Ideational fluency: Ability to rapidly produce a series of ideas, words, or phrases related to a specific condition or object. Quantity is emphasized instead of quality or originality. • [Progress bar]

• Associational fluency: Ability to produce a series of words or phrases associated in meaning to a word or concept with a limited range of meaning. Quality is emphasized instead of sheer quantity. • [Progress bar]

• Expressional fluency: Ability to rephrase an idea without losing its original meaning. Rephrasing is emphasized here instead of idea generation. • [Progress bar]

- Word fluency: Ability to produce words that have given characteristics.

When we remember, we don't just access
our memories; we rewrite them.

You don't know a language, you live it. You
don't learn a language, you get used to it.

but going to such lengths and being willing
to do whatever it takes, no matter what the
level of embarrassment, will greatly
improve your chances of being successful.

I am getting better at learning languages
with age, not worse!

My point is that we all have our
advantages,

Progress happens if you set aside the time
to allow it to happen.

activities that will keep you in genuine interactions with human beings.

If what you're doing is boring, then stop what you're do

ing. This doesn't mean that learning a language is boring,just that the way you're trying to do it right now is.

THE SCHIZOID CONDITION [] [] [] [] [] [] [] [] The
Picture of the Shut-in Individual [] [] [] [] [] [] [] []

only deal by abdicating the relationship as
her major defence against her anxieties
was to keep herself emotionally out of
reach, inaccessible, and keep everyone at
arm's length. She once said: 'I'd rather hate
you than love you', but this goes even
further. She will neither love nor hate, she
won't feel anything at all, and outwardly
in sessions often appeared lazy, bored at
coming, and with a laissez faire attitude.
This then is the problem we seek to under-
stand. The schizoid condition consists in
the first place in an attempt to cancel
external object-relations and live in a

Living in an Internal World

Quite specially in this region lie the schizoid's problems. He is driven by anxiety to cut himself off from all object-relations.

The diagram illustrates a 16-bit bus system. It consists of 16 parallel channels, each represented by a horizontal row of 16 small squares. These squares are arranged in a grid-like pattern, with 16 rows and 16 columns. The top 15 rows are connected to a common horizontal line on the left, which then branches into 16 vertical lines, each entering a square in the first column of the grid. The bottom row is connected to a common horizontal line on the left, which then branches into 16 vertical lines, each entering a square in the first column of the grid. The squares are arranged in a grid-like pattern, with 16 rows and 16 columns. The top 15 rows are connected to a common horizontal line on the left, which then branches into 16 vertical lines, each entering a square in the first column of the grid. The bottom row is connected to a common horizontal line on the left, which then branches into 16 vertical lines, each entering a square in the first column of the grid.

“ ” “ ”

He felt that his anger came from somewhere outside him. He felt that he was “not himself” for a few moments. But in fact this surge of ungovernable emotion did come from a part of him, a place deep within that he couldn’t see with his conscious mind. It is because of this invisibility that this place within is called the “unconscious.”

The unconscious manifests itself through a language of symbols.

It has two natural pathways for bridging the gap and speaking to the conscious mind: One is by dreams; the other is through the imagination. Both of these are highly refined channels of communication that the psyche has developed so that the unconscious and conscious levels may speak to one another and work together.

The unconscious has developed a special language to use in dreams and imagination: It is the language of symbolism. As we will see, inner work is primarily the art of learning this symbolic language of the unconscious. Therefore we will devote most of our time to working with dreams, imagination, and the uses of symbolism.

—————
[A series of 30 empty rectangular boxes arranged in a single row.]

He showed that the unconscious is the creative source of all that evolves into the conscious mind and into the total personality of each individual. It is out of the raw material of the unconscious that our conscious minds develop, mature, and expand to include all the qualities that we carry potentially within us.

beings, we must go to the unconscious and set up communication with it. Much of ourselves and many determinants of our character are contained in the unconscious. It is only by approaching it that we have a chance to become conscious, complete, whole human beings. Jung has shown that by approaching the unconscious and learning its symbolic language, we live richer and fuller lives. We begin to live in partnership with the unconscious rather than at its mercy or in constant warfare with it.

[A series of 30 empty rectangular boxes arranged in a single row.]

Jung showed us that the conscious and the unconscious minds both have critical roles to play in the equilibrium of the total self. When they are out of correct balance with one another, neurosis or other disturbances result.

Source of all our human consciousness, it is the source of our human capacity for orderly thought, reasoning, human awareness, and feeling. The unconscious is the Original Mind of humankind, the primal matrix out of which our species has evolved a conscious mind and then developed it over the millennia to the extent and the refinement that it has today. Every capacity, every feature of our functioning consciousness, was first contained in the unconscious and then found its way from there up to the conscious level.

the physical stage and decide how you are going to record your Active Imagination.□□□

These details are more

important than you might think. Many people give up on Active Imagination before they get started because they can't find a convenient way to record the imagination as it flows out. 

□□□ We have already talked about the importance of writing your inner work. This is even more true of Active Imagination.

Your inner dialogue should be written or typed. This is your major protection against

member and digest the experience afterwards.

Writing is not the only mode of recording your Active Imagination. Later I will mention some other approaches. But for most people writing is the easiest, most effective way.

In mezzo del camin di nostra vita
Mi ritrovai per una selva oscura
Che la diritta via era smarrita
E quanto a dir qualera e cosa dura
.....Questa selva selvaggia...
..... In the midpoint of this journey that is
our life I found myself passing
through a dark forest,
The right path through which had
disappeared. And what a hard
thing it is to speak of that
savage forest.....—Dante, Divine
Comedy—

The first step in Active Imagination is to
invite the creatures of the unconscious to
come up to the surface and make contact
with us. We invite the inner persons to start
the dialogue.
"

How do we make this invitation? We begin
by taking our minds off the external world
around us and focusing on the imagination.
We direct our inner eye to a place inside
us, then we wait to see who will show up.
"

We need all the information we can get. 

We need all the information we can get. 

The scholars started to believe that they could move from certainty (fact) to certainty without any need for the messiness of 'possibility'. So they never developed the possibility system: hypothesis, speculation, imagination, etc.

The scholars started to believe that they could move from certainty (fact) to certainty without any need for the messiness of 'possibility'. So they never developed the possibility system: hypothesis, speculation, imagination, etc.

Thinking is the most fundamental of
all human abilities.

The way personal growth is supposed to progress, according to Jung, is that we first develop what comes naturally—introversion or extroversion.

To be yourself in a world that is constantly trying to make you something else is the greatest accomplishment.
—Ralph Waldo Emerson—
· · ·

Your nature is not the problem. The problem is that you have become alienated from your nature—from your power source.

As Isabel Briggs Myers discussed in her book, *Gifts Differing*, "The best-adjusted people are the 'psychologically patriotic,' who are glad to be what they are." For introverts this means, "Their loyalty goes to their own inner principle and derives from it a secure and unshakable orientation to life." [REDACTED]—[REDACTED]

[REDACTED]—[REDACTED]·[REDACTED]·[REDACTED]

[REDACTED]"[REDACTED]'[REDACTED]'[REDACTED]"[REDACTED]

promise meaningful interaction. In fact, she knows that the party will leave her feeling more alone and alienated. Her social preference may be to stay home and reflect on a conversation with a friend, call that friend, and come to an understanding that is meaningful to her. Or she might indulge in the words of a favorite author, feeling a deep connection with a person she has never met. From the perspective of a partygoer, this introvert may appear to be asocial, when, in fact, the introvert is interacting in a much different way. [REDACTED]

[REDACTED]

spacious interactions with fewer people. And it means that, when you converse, you are more interested in sharing ideas than in talking about people and what they're doing. In a conversation with someone sharing gossip, the introvert's eyes glaze over and his brow furrows as he tries to comprehend how this conversation could interest anyone. This is not because the introvert is morally superior—he just doesn't get it. As we've discussed, introverts are energized and excited by ideas. Simply talking about people, what they do and who they know, is noise for the

The consistent finding was that, as predicted, introvert brains were busier than extrovert brains.

We Are Introverts, and we are going home.

Where there is too much input, the
introvert misses his mind, his subjectivity,
his freedom, his very potential.

Introverts spend a lot of time pondering the big questions. Our love of ideas often inspires us to pursue noble work. But, as we soon find, these jobs don't pay us for sitting in a soft chair and thinking big thoughts. Once on the job, we discover—to our horror—that we are expected to carry out the big ideas, and that usually means talking to PEOPLE.

I said to myself, "I have things in my head that are not like what anyone has taught me"...I decided to start anew—to strip away what I had been taught—to accept as true my own thinking. "....." "....." "....."—Georgia O'Keefe-

release what's inside while maintaining privacy. Go ahead, scream on the paper or whisper your secrets. It's your paper.

Whether you just need to vent or have a book inside you, here are some tips for getting started: [REDACTED]

[REDACTED]

[REDACTED]

[REDACTED] • Write daily.

Even a small chunk of time, fifteen or twenty minutes each day, gets your mind oriented to what you're putting on the paper. Just as small, frequent meals aid metabolism of food, small, frequent writing sessions aid metabolism of ideas. I tell my

"shitty first drafts." If you are writing only for yourself, the function is just to get it out: forget punctuation and grammar.

Practice not editing. Write down your shopping list if that's on your mind, or write about why you don't want to write. See if you can "talk" on paper. Listen to your thoughts and record what they say. If you are writing for literary purposes, practice shitty first drafts, and go back and edit your work as many times as necessary. • [REDACTED]

[REDACTED] • [REDACTED] " [REDACTED]" [REDACTED]

[REDACTED]

[REDACTED] " [REDACTED]" [REDACTED]

[REDACTED] • Tell

[REDACTED]

[REDACTED]

[REDACTED] • Make it easy. Have your materials ready. If you want a special "container" for your thoughts, take the time to browse the aisle of journals at your favorite bookstore. I think of a journal in the way Mr. Ollivander of the Harry Potter world regarded the right wand: it will pick you. On the other hand, some beautiful journals are left untouched because the writer is afraid to spoil it. A journal is not effective if it inhibits the writer. Sometimes a cheap notebook is a better option. Or, look in the dollar bins at

[illegible]

□□□□□□ • Record life. Anne Lamott emphasizes the importance of taking notes rather than trusting memory. Her advice: always carry a pen and some index cards. Jot down enough to remind you of your ideas and observations, then pull out your cards at your daily writing session and

□□□□ • Write your pain. James W. Pennebaker and his associates at the University of Texas have conducted extensive research on the benefits of journaling. His findings: if you want relief, write about your most upsetting experiences, write through the pain, and connect painful events with your life story. Getting to the tough stuff was a key factor in helping people feel better and move on.

A number line from 0 to 100. The first row of boxes represents the numbers 0 to 100. The second row shows a jump of 20 from 0 to 20, and a jump of 80 from 20 to 100.

The Challenge Of Success
The hard part of
succeeding in this world goes from the
desire of making

money, to knowing you could make
more and deliberately choosing to do things
for your soul instead.

Every transformation demands as its
precondition “the ending of a world”—the
collapse of an old philosophy of life.      
      “                                                        C. G. Jung  

behaviors requires identifying what emotional reality or perception we are defending against through the addiction and risk bearing what has been perceived as unbearable. Going through the fear, rather than defending against it, is the only way we can stop Ixion's wheel. It is no shame to fear abandonment, suffer boredom, or experience depression. Until we can feel these things—really feel them and not anesthetize them—we will remain unmotivated to change our lives. 

We need to find what supports us when
nothing supports us. By bearing the
unbearable, we go through the desert to
arrive at a nurturing oasis we did not know
was there. 

Our nature is forever changing and seeking
growth; when outer forces or inner
resistance oppose that growth, we
experience a terrible deadening of the
spirit.

“This is Me”“”The Development of My
Professional Thinking and Personal
Philosophy

I speak as a person, from a context of
personal experience and personal
learnings.

In fact, it seems to me that most of the
mistakes I make in personal relationships,
most of the times in which I fail to be of
help to other individuals, can be accounted
for in terms of the fact that I have, for
some defensive reason, behaved in one
way at a surface level, while in reality my
feelings run in a contrary direction.

What I am saying here, put in another way, is that I have not found it to be helpful or effective in my relationships with other people to try to maintain a façade; to act in one way on the surface when I am experiencing something quite different underneath. It does not, I believe, make me helpful in my attempts to build up constructive relationships with other individuals.

somewhat more adequately than I used to, what I am feeling at any given moment—to be able to realize I am angry, or that I do feel rejecting toward this person; or that I feel very full of warmth and affection for this individual; or that I am bored and uninterested in what is going on; or that I am eager to understand this individual or that I am anxious and fearful in my relationship to this person. All of these diverse attitudes are feelings which I think I can listen to in myself. One way of putting this is that I feel I have become more adequate in letting myself be what I am. It becomes easier for me to accept myself as

This must seem to some like a very strange direction in which to move. It seems to me to have value because the curious paradox is that when I accept myself as I am, then I change. I believe that I have learned this from my clients as well as within my own experience—that we cannot change, we cannot move away from what we are, until we thoroughly accept what we are. Then change seems to come about almost unnoticed.

Another result which seems to grow out of being myself is that relationships then become real. Real relationships have an exciting way of being vital and meaningful.

Each person is an island unto himself, in a very real sense; and he can only build bridges to other islands if he is first of all willing to be himself and permitted to be himself.

THE MOTIVATION FOR CREATIVITY

The mainspring of creativity appears to be the same tendency which we discover so deeply as the curative force in psychotherapy—man’s tendency to actualize himself, to become his potentialities.

THE INNER CONDITIONS OF CONSTRUCTIVE
CREATIVITY

A. Openness to experience: Extensionality.

This means that instead of perceiving in predetermined categories (“trees are green,” “college education is good,” “modern art is silly”) the individual is aware of this existential moment as it is, thus being alive to many experiences which fall outside the usual categories (this tree is lavender; this college education is damaging; this modern sculpture has a powerful effect on me).

B. 

B. An internal locus of evaluation. Perhaps the most fundamental condition of creativity is that the source or locus of evaluative judgment is internal. The value of his product is, for the creative person, established not by the praise or criticism of others, but by himself.

C. The ability to toy with elements and concepts.

play spontaneously with ideas, colors,
shapes, relationships—to juggle elements
into impossible juxtapositions

C. 

to share his creation is the only way he can assuage the anxiety of separateness and assure himself that he belongs to the group. He may confide his theories only to his private diary. He may put his discoveries in some cryptic code. He may conceal his poems in a locked drawer. He may put away his paintings in a closet. Yet he desires to communicate with a group which will understand him, even if he must imagine such a group. He does not create in order to communicate, but once having created he desires to share this new aspect of himself-in-relation-to-his-environment with others. 

From the very nature of the inner conditions of creativity it is clear that they cannot be forced, but must be permitted to emerge. The farmer cannot make the germ develop and sprout from the seed; he can only supply the nurturing conditions which will permit the seed to develop its own potentialities. So it is with creativity.

Note that it is complete freedom of symbolic expression which is described. To express in behavior all feelings, impulses, and formings may not in all instances be freeing. Behavior may in some instances be limited by society, and this is as it should be. But symbolic expression need not be limited. Thus to destroy a hated object (whether one's mother or a rococo building) by destroying a symbol of it, is freeing. To attack it in reality may create guilt and narrow the psychological freedom which is experienced.

You can Orbit too soon, and it can turn out badly. So it is important to grow into readiness.

In desperation over the ineffectual attempts of a string of medical specialists to “cure” me, I turned inward. I began keeping a personal journal of my feelings and thoughts about the illness, the doctors, my life, and myself. I stopped taking medication and started concentrating on journal-keeping. It was the only thing that gave me relief. It also helped me develop enough insight and courage to enter psychotherapy for the first time.

As members of a so-called advanced society, we are taught to place a higher value on the “civilized,” rational, adult self. We look down upon the qualities of the “other side”—the intuitive, emotional, artistic, poetic, childlike, and non-rational. So here we have a civil war within the psyche—a split mind (schizophrenia).
“I am not a person, I am a machine.”
—“I am not a machine, I am a person.”
“I am not a person, I am a machine.”

Action has meaning only in relationship and without understanding relationship, action on any level will only breed conflict. Understanding of relationship is infinitely more important than the search for any plan of action. —J. KRISHNAMURTI —

me, up to my neck is realization may be called the stage of ADD epiphany, the annunciation, characterized by elation, insight, enthusiasm and hope. It seemed to me that I had found the passage to those dark recesses of my mind from which chaos issues without warning, hurling thoughts, plans, emotions and intentions in all directions. I felt I had discovered what it was that had always kept me from attaining psychological integrity: wholeness, the reconciliation and joining together of the disharmonious fragments of my mind.

Ritalin. Already in my fifties, I was a successful and respected family doctor whose columns of medical opinion were praised for their thoughtfulness. I practice medicine with a high value on avoiding pharmacology unless absolutely necessary, and needless to say, I have always advised patients against self-medicating. Such striking imbalance between intellectual awareness on the one hand and emotional and behavioral self-control on the other is characteristic of people with attention deficit disorder.

50

Even if in many cases medications do help, the healing ADD calls for is not a process of recovery from some illness. It is a process of becoming whole—which, it so happens, is the original sense of the word healing.

—

e DSM IV defines attention deficit disorder by its external features, not by its emotional meaning in the lives of individual human beings. It commits the faux pas of calling these external observations symptoms, whereas that word in medical language denotes a patient's own felt experience. External observations, no matter how acute, are signs. A headache is a symptom. A chest sound registered by the doctor's stethoscope is a sign. A cough is both a symptom and a sign.

DSM IV [REDACTED]
[REDACTED] " [REDACTED]
[REDACTED]
[REDACTED]

strangely dissonant imagery tells also of a troubled soul who found reality harsh—so harsh that the mind had to be fragmented in order to fragment the pain.

absence of mind is one cause of the distractibility and short attention spans that bedevil the adult or child with ADD, except around activities of high interest and motivation. ere is an almost active notnoticing, as if a person purposefully went out of her way to be oblivious of what is around her.

one of the volumes to place it beside its companion. Turning a page, you begin to read a poem. The poem has a classical reference in it, which prompts you to consult your guide to Greek mythology; now you are lost because one reference leads to another. An hour later, your interest in classical mythology exhausted for the moment, you return to your intended task. You are hunting for the missing half of a pair of socks that has gone on furlough, perhaps permanently, when another item of clothing on the floor reminds you that you have laundry to wash before the evening. As you head

Completely lacking in the ADD mind is a template for order, a mental   model of how order comes about.

Active attention is a capacity the ADD brain lacks whenever organized work must be done, or when attention needs to be directed toward something of low interest.

A facility for focusing when one is interested in something does not rule out ADD, but to be able to focus, the person with ADD needs a much higher level of motivation than do other people.

The second nearly ubiquitous characteristic of ADD is impulsiveness of   word or deed, with poorly controlled emotional reactivity.

Hyperactivity is the third salient
characteristic of ADD.

machine.

without specific aim or direction. As long ago as 1934, an article in the New England Journal of Medicine identified a distressing quality to some people's lives, which the authors called "organic drivenness." I, for one, have rarely had a moment's relaxation without the immediate and troubling feeling that I ought to be doing something else instead. Like father, like son. At the age of eight or nine, my son said to me, "I always think I should be doing something, but I don't know what it is." The oldest person to whom I have prescribed a stimulant was an eighty-five-year-old woman who, on taking Ritalin, was

The restlessness coexists with long periods of procrastination. The threat of failure or the promise of reward has to be immediate for the motivation apparatus to be turned on. Without the rousing adrenaline rush of racing against time, inertia prevails. Not once in high school or university did I begin an assignment or essay before the eve of the day it was due.

On the other hand,when there is something
one wants, neither patience nor
procrastination exist. One has to do it, get
it, have it, experience it, immediately.

"I am a person of permanent potential," one patient said. Surges of initial enthusiasm quickly ebb. People report unfinished retainer walls begun over a decade ago, partly constructed boats taking up garage space year after year, courses begun and quit, books half read, business ventures forsaken, stories or poetry unwritten—many, many roads not traveled.

dominates, characteristic of young children: if I will it, it will happen. In magic anything is possible. Castles can be built or destroyed with the wave of a wand, worlds traversed in seven-league boots, you can get from Oz to Kansas by clicking your heels together. Magic vanquishes time. [REDACTED]

[REDACTED]

[REDACTED] No infant is born with a sense of time. The gradual acquisition of time sense is a task of development that begins in early childhood. At the outset, the infant has no categories such as time, space or causality,

as if blessed with the gift of eternity. It’s as if one’s time sense never developed past a stage other people leave behind in early childhood. [REDACTED]

[REDACTED] ADD [REDACTED] “ [REDACTED] ” [REDACTED] · [REDACTED] [REDACTED] Russell Barkley [REDACTED] “ [REDACTED] ” [REDACTED] [REDACTED]

[REDACTED] To the very young child, any block of time seems infinite. Tell her that supper will be ready in three minutes: desperate wailing will signal her conviction that you have sentenced her to starvation. Tell her to hurry because time is running out, and she will not know

like believing that if there are three generations of butchers or bakers or candlestick makers in a family, then meat cutting, baking and candle manufacturing must also be genetic. The family atmosphere in which the child spends the early formative years has a major impact on brain development. It is obvious that brain/mind problems such as ADD are far more likely to develop in families where the parents are struggling with dysfunction or psychological problems of their own. It would be astonishing if children growing up in such unsettled environments did not develop some of the same problems. No

Sensitivity is the reason why allergies are more common among ADD ████████████████████
██████

ey both are expressions of the same underlying inborn trait: sensitivity. Since emotionally hypersensitive reactions are no less physiological than the body's allergic responses to physical substances, we may say truthfully that people with ADD have emotional allergies.

So, energy. With its usual wisdom, everyday language has found an accurate description of hypersensitivity when it speaks of someone having a thin skin. If one had an area on one's thigh with part of the epidermis destroyed by, say, scalding hot water, one literally would have a thin skin: the nerve endings would be closer to the surface. A slight gust of air might cause a highly unpleasant sensation, even pain, whereas surfaces with full-thickness skin would feel little or nothing. The emotionally sensitive person lives, as it were, with the nerve endings that send emotional stimuli

Like hypersensitive instruments, sensitive children register and record even minute changes in their emotional environment. It is not a matter of choice for them; their nervous systems react. It is as if they had invisible antennae projecting in every direction, picking up and conducting into their bodies and their minds the psychic emanations around them. ey may have no conscious knowledge of this, any more than an instrument is consciously aware of what measurements it is registering. Unlike instruments, however, the sensory equipment of human beings is not easily shut off.

advantage for humankind because it is this group that best expresses humanity's creative urges and needs. rough their instinctual responses the world is best interpreted. Under normal circumstances, they are artists or artisans,seekers, inventors, shamans, poets, prophets. ere would be valid and powerful evolutionary reasons for the survival of genetic material coding for sensitivity. It is not diseases that are being inherited but a trait of intrinsic survival value to human beings. Sensitivity is transmuted intosuffering and disorders only when the world is unable to heed the exquisitely tuned physiological and psychic

e tense or depressed mothering adult will not be able to accompany the infant intorelaxed, happy spaces. He may also not fully pick up signs of the infant's emotional distress, or may not be able to respond to them as effectively as he would wish. e ADD child's difficulty reading social cues likely originates from her relationship cues not being read by the nurturing adult,who was distracted by stress.

Infants whose caregivers were too stressed, for whatever reason, to give them the necessary attunement contact will grow up with a chronic tendency to feel alone with their emotions, to have a sense—rightly or wrongly—that no one can share how they feel, that no one can “understand.” Attunement is the quintessential component of a larger process, called attachment.⁷ Attachment is simply our need to be close to somebody. I

[illegible]

Nature's goal for human growth is for the eventual maturation of a self-motivated, self-regulated and self-reliant adult. e infant lacks these attributes. We may say that the natural agenda is really the transformation of regulation from dependence on another individual to independence, from external regulation to internal regulation.

When visual-spatial orientation is impaired, a person tends to bump his head a lot or run into people unseeingly and have difficulty following physical directions—all features of ADD I am intimately familiar with. 

When I first took an antidepressant in my midforties, I was amazed at the difference. Curiously, I felt much more like myself. It was as if a fog had evaporated and I saw that for years previously I'd had only periodic glimpses of a life not burdened by negative feelings.

Family strife and parental depression
contribute to the child's ADD [REDACTED]
[REDACTED]ADD[REDACTED]

personality disorder, but I use the term in its general sense. Dissociation, including the tuning-out of ADD, originates in a defensive need—it is a form of psychological defense. Gloucester's motive to be "distract," in the fourth act of King Lear, is very close to the source of the "distractness" of ADD. It is a way of coping with emotional hurt. The original purpose of dissociation is to separate conscious awareness from some emotional pain we are experiencing, to dis-associate one from the other. We may think of dissociation as a psychological anesthetic. [REDACTED]

Chronic distress does—the distress of the sensitive infant with unsatisfied attunement needs, for example. The infant has to dissociate chronic emotional pain from consciousness for two reasons. First, it is too overwhelming for his fragile nervous system. He simply cannot exist in what we might call a state of chronic negative arousal, with adrenaline and other stress hormones pumping through his veins all the time. It is physiologically too toxic. He has to block it out. Second, if the parent's anxiety is the source of the infant's distress, the infant unconsciously senses

“ ” —

—

e survival value of all psychological
defenses is relatively short-lived.

never learn to cope with emotional setbacks in a creative and positive way. We may compare any psychological defense to a heavy fur coat a man in a cold northern climate puts on to keep from freezing. Wearing the fur coat saves his life. Let's imagine that he is suddenly transported to the equator, coat still on. He would soon find that the clothing that helped him survive in the north makes him most uncomfortable or even ill in his new circumstances. Of course, our traveler is free to remove his coat. e problem with unconscious psychological defenses is that they cannot be shed at will. ey were

cerebral apparatus of awareness: unless some other special switch is turned on, tuned out will be the state that the brain automatically returns to. Because tuning out is based on deeply entrenched neurological responses, their later activation requires very little stimulus. Once a circuit is established, signals will travel along it much more easily than along alternative routes, in a manner analogous to the ease of walking along a beaten path rather than through grass or bush on either side of it, or water flowing in a channel instead of across flat ground. If we want

Although we think of attention as a function of the intellect, its deepest roots are in the subsoil of emotion.

Emotions remain the basis of attention, even after the intellect comes to dominate our conscious thought.

In fact, there is a close link between the visual and attentional systems: a powerful incentive for the development of both is the infant's emotional relationship with the mothering adult.

Her brain's attentional system cannot switch into "schoolwork mode" when it is consumed by anxieties about the child's emotional connection with the world.

never noticed because she was not hyperactive, only a day-dreamer, told me that she spent entire school days staring out the window, lost in fanciful adventures with imaginary friends. From the outside, one might have described her as "distracted." The Latin root of distract is "draw away"—drawing her away from the inside was her hiddenmost emotional longing. Her brain unconsciously assigned greater value to a self-created internal universe than to anything or anyone in the classroom.

ADDITIONAL INFORMATION

ADDITIONAL INFORMATION

undetermined to when the child is not concerned with seeking emotional contact, his prefrontal cortex is freed to allocate attention to the task at hand, illustrating that what we call attention deficit disorder is not a fixed, unalterable physiological state; it's a physiological state, yes, but not fixed and unalterable. The warmth and satisfaction of positive contact with the adult is often just as good as a psychostimulant in supplying the child's prefrontal cortex with dopamine. Greater security means less anxiety and more focused attention. The unseen factor that remains constant in all situations is the

when our attentional resources are consumed by internal thoughts and feelings, there are few left over for dealing with the world outside."7

I do not know if you have noticed that the moment you cease to be active, there is immediately a feeling of nervous apprehension; you feel as though you are not alive, not alert, so you must keep going. And there is fear of being alone, of going for a walk alone, of being by yourself, without a book, without a radio, without talking; the fear of sitting quietly without doing something all the time with your hands or with your mind or with your heart.

7

restless movements for more than a few minutes. Always, one is caught in a mental whirlwind. A seventy-two-year-old man, a geologist, called it "newsreel thinking," by which he meant the rapid shifting of his thoughts from one subject to another. (He had originally trained as an engineer but could not abide the confines of an office. He switched to geology because the work allowed him to be outdoors, on the move.) Another sign of hyperactivity may be frequent movement of the eyes, a scanning of the environment that frustrates other people. It is disconcerting to be with an individual who seems to be always on the

close to you, and that you were helpless to do anything to prevent it, your response would quite probably resemble the habitual mental and physical behaviors of the hyperactive child or adult with ADD. YOU would have difficulty focusing your thoughts, and your mind might feel like a squirrel on a treadmill: racing but not going anywhere. Sitting still would be a chore. A clichéd image of helpless anxiety in an adult is the father pacing nervously outside the delivery room where his wife is giving birth. I believe hyperactivity in ADD is fed by a current of permanent, subterranean

and underarousal express shame. Shame, like anxiety, is an attachment emotion. “Whenever someone becomes significant to us, whenever another’s caring, respect or valuing matters, the possibility for generating shame emerges,” writes the psychologist Gershen Kaufman.² The origin of shame is the feeling of having been cut off from the parent, of having lost the connection, if only momentarily. It cannot be helped, it occurs unavoidably as part of maturing. [REDACTED] [REDACTED] Gershen Kaufman [REDACTED] “ [REDACTED]

calls “restoring the interpersonal bridge.” Chronic stress experienced by the parent has the effect of breaking that bridge. A small child does not have a large store of insight for interpreting the parent’s moods and facial expressions: they either invite contact or forbid it. When the parent is distracted or withdrawn, the older infant or toddler experiences shame. Shame postures are observed in infants in response to nothing more than the parent breaking eye contact. The demeanor of the infants of depressed mothers is one of inactivity and the averted gaze. [REDACTED]

... frequently offend people or break a promise or be late somewhere. Given his inattentiveness and difficulties reading nonverbal social messages, he treads on toes—in both senses of that phrase. He carries memories of having failed at many tasks, of being deservedly criticized—so he thinks—for many shortcomings. Such events, however, can only reinforce shame or provoke it—they cannot cause it. Its origins have nothing to do with bad deeds, failures or hurting anyone. Like its opposite number, hyperactivity, shame began as a normal physiological state that escaped regulation by the cortex. It becomes wound

are able to express anger without making the child feel cut off emotionally. They convey disapproval without rejection.

Other parents, especially those with self-regulation problems of their own, may react with open or choked rage, punishing coldness or dejected withdrawal that signals defeat and disappointment. These were the anger responses my children experienced from me. Each time this happens, shame is evoked in the child, especially as the parent usually believes—and makes the child believe—that whatever his (the parent’s) reaction is, the child is responsible for it. question, when I interrupt their flow of speech to ask for more information, when I tell them that we will wind up the session in a few minutes as time is running out.

[illegible]

ADD swings back and forth between over-the-top, purposeless excitement and a nonrestful vegetative state in which the predominant emotion is shame. Some tend to get stuck at one or the other of these opposite poles. The two states may also be present at the same time, resulting in agitated, unfocused inactivity. ADD

memories of the distant, stressed or
distracted caregiver. ere will be a sense of
discomfort as soon as the mind becomes
aware of itself, because such awareness
immediately triggers responses encoded
with the infant's distress at feeling
emotionally alone. e mind then lapses into
helpless lethargy, or races away, looking
for something to attach to: some idea,
some fantasy, some memory, conversation,
music, reading—anything. When it cannot
do so, there is intense unease—or the
aversion to one's own mind, which we call
boredom.

A requirement of healing, becoming whole,
is circuitry in the brain that can carry
different messages and a different,
nonhelpless image of the self. ere is strong
evidence that such circuits can develop at
any time in life, as can neural pathways to
help the cortex to do its job of inhibition
and regulation.

It is not curing that ADD children need:
they need to be helped to grow. What is
required is not a change in parenting
techniques but a change in parenting
attitudes, based on a deeper
understanding of the child. e adult with
attention deficit disorder needs also to gain
a deeper understanding of herself, to
undertake the task we will later describe as
self-parenting.

We see this in attention deficit disorder when the same child is able to attend to a subject in one type of environment but is unable to concentrate on the same topic in another. is situationality of ADD reflects the input of emotions, which play a powerful role in attention.

Integration of cognition with emotion—the melding of what we know with what we feel—is the very integration the healing process in ADD requires. Lack of it underlies the fragmentation of the ADD mind.

understandable desire of parents is for point-by-point advice: What do I do in this situation? How do I handle that? Important as such questions are, they are secondary. e answers to them depend on how one interprets the child's behaviors and on what the long-term objectives are. What we want to promote is not a mere change of behavior but a transformation of inner experience leading to the development of self-regulation.

[illegible]

Every child with ADD has been wounded by a disruption in the  relationship between the caregiver and the sensitive infant. All the behaviors and mental patterns of attention deficit disorder are external signs of the wound, or inefficient defenses against feeling the pain of it. If development is to take place, energy has to be liberated for growth that now is consumed in protecting the self from further hurt. The key factor is cementing the attachment relationship. 

us, it is important to stimulate the portion of the brain that initiates emotional expression,” Dr. Cleve Diamond writes. “Satisfying emotional needs is essential at any age.”⁷

In human brains, the circuitry of reason and emotion are closely connected, which is why troubled relationships lead directly to difficulties in brain processing. They are not the only cause of disorganized thinking, but they are by far the commonest cause. Restoring relationships on a healthy basis promotes mental organization. New ways of processing emotions need new neural circuits, and the wiring of new circuits requires new experiences in a favorable emotional milieu. The relationship with the parents is the earth, the rain, the sun and the shade in which the child's mental development must blossom

some space in the child's heart of hearts for the certainty that she is precisely the person the parents want and love. She does not have to do anything, or be any different, to earn that love—in fact, she cannot do anything, because the love cannot be won and cannot be lost. It is not conditional. It is completely independent of the child's behavior. It is just there, regardless of which side the child is acting from, "good" or "bad." The child can be ornery, unpleasant, whiny, uncooperative and plain rude, and the parent still lets her feel loved. Ways have to be found to let the child know that certain behaviors are

Its blood will neither chill nor overheat, no matter what the external temperature. The cold-blooded animal can endure a far narrower range of habitats because it does not have the capacity to self-regulate the internal environment. People with ADD, especially children, are like cold-blooded animals, in this sense. Their internal balance is too easily upset by even relatively slight external variations. They are too often reacting automatically instead of acting purposefully. Many find transitions stressful because they are not flexible enough to adjust emotionally to even small changes. Others with ADD thrive on constant turmoil

the child's moods to set the emotional tone of the whole household. A child in this situation is deeply insecure. He is made insecure by his lack of emotional self-control because there are no adults around able to maintain a steady and functioning environment, whatever his own particular internal states may be. There is no development amid such a lack of safety. It only appears that the child's moods are in control, because the parents are unaware of how profoundly their own mind states and their own lack of internal self-regulation affect the child. It's another vicious cycle. The parents need the child to

e professional literature on ADD talks of “maintenance factors” that ADD “reinforce or trigger ADD traits. No maintenance factor is more powerful than the emotional states of the parents. Unresolved psychological conflicts between the parents, and within each parent individually, are a major source of unrest for the hypersensitive ADD child. is anxiety absorbed by sensitive children will lead to hyperactivity or other ADD-related behaviors. ADHD

Self-accepting person, a true individual is the ultimate goal of development. As individuation unfolds, children are able to move more and more independently into the world, impelled by their own interests and needs. Less and less do they require that another person see exactly what they see in order to feel validated, or that another person feel exactly what they feel. They may have needs and desire for closeness, warmth and mutual support with another human being, but they do not need to be emotionally fused with the other person—they can function on their

ADHD

relationships with their partners, especially after children begin arriving to upset the fragile emotional balance between them. They are also likely to fuse emotionally with one or another of their children. There may be the semblance of a close relationship between parent and child, but in reality the child's individuation is hindered, as he grows up feeling automatically responsible for the parent's feeling states. Later the child will harbor a sense of responsibility for the whole world. Even what can be seen as selfish behaviors represent nothing more than unconscious and desperate efforts to throw off that sense of

They learned to see their son as a separate individual rather than as an extension of themselves, no longer feeling personally devastated when he experienced distress or acted out in some immature fashion.

ADHD

When we consider the word lazy, we realize that it does not explain anything. It is only a negative judgment made about another person who is unwilling to do what we want them to do.

So the laziness and the procrastination are not immutable traits of a person but expressions of his relationship with the world, beginning with the family of origin.

And one may choose what is contrary to one's own interests and sometimes one positively ought ... One's own free unfettered choice, one's own caprice, however wild it may be, one's own fancy worked up at times to frenzy ... What man wants is simply independent choice, whatever that independence may cost and wherever it may lead. [REDACTED]

resistance arising from the fear of being controlled. Counterwill arises in anyone who has not yet developed a mature and conscious will of her own. Although it can remain active throughout life, normally it makes its most dramatic appearance during the toddler phase and again in adolescence. In many people, and in the vast majority of children with ADD, it becomes entrenched as an ever-present force and may remain powerfully active well into adulthood. It immensely complicates personal relationships, school performance and job or career success. “[REDACTED]

her behavior is present when the four-year-old puts both hands over his ears to keep out the parent's voice, or when the older child pins up an angry Keep Out sign on her door. It is visible in the body language of the adolescent and teenager: the sullen look and the shrugged shoulder. Its signs drive some adults around the bend, as in the futile “I'll wipe that smirk off your face” of many a parent or teacher. Counterwill is also expressed through passivity. Every parent of an ADD child has had the experience of feeling intense frustration when, being pressured for time, they have

For ADD children (and for ADD adults), it's all or nothing. When anger arises, all feelings of attachment and love are banished. Since counterwill grows as attachment weakens, the child who is upset and angry may, in that moment, resist the parent with the emotional fury one would feel toward a despised enemy.

ADD, all ADD children are unmotivated. Their absence of motivation is evident not only when it comes to activities and tasks expected of children their age but even in their approach to projects and plans that originally aroused their interest and enthusiasm. A lack of inner-directed purpose also typifies a large number of ADD adults.

As with every aspect of the development of the ADD child, the growth of true, internal motivation requires a secure attachment relationship with the parent. Without the safety of the attachment relationship, the small child will be too anxious to focus his attention on a meaningful exploration of the world around him.

True autonomy requires that the parents provide a supportive structure. 

Without parental empathy, the child shuts
down and hides behind the wall of
emotional defenses; without structure, he
becomes lost, uncertain and anxious

children are driven to act out every strong
feeling and every urge—it is the only way
they can express themselves. They are thus
unable to take charge of themselves,
impelled as they are to act by emotions
they cannot identify. Without learning to
symbolize emotions they are also likely to
experience everything in terms of simple
and opposing categories: people are
alternately mean or nice, good or bad. It's
either "I love you, Mommy" or "I hate you."
The child has greater autonomy, a greater
choice of possible responses, when she can
say, "I didn't like what Mrs. So-and-so said
to me in class today," than when she is

socialization. Because it is a fundamental human drive, we naturally develop connectedness and compassion if our own basic needs have been respected. Socialization is at the apex of a pyramid. The base is formed by secure attachment and autonomy. We often make the mistake with our children of putting socialization—the rules of social conduct, what is called “good behavior”—ahead of attachment and individuation. We try to make our kids act as truly socially responsible people at the expense of their emotional security and their autonomous sense of self. It may

am. It might sound strange, coming from an ex- drug addict, or however you want to phrase it—a clean addict now, a soberdrunk—but I don’t want to alter my mind with drugs as behavior control. I am the way I am as a result of my upbringing, the influence the world has had on me, what I have seen, my experiences. I am not about to try to change because some people say I’ve got a problem. And maybe I do.”“If you don’t think it’s a problem for you,” I said, “there is no reason you should take medications.”“It’s not that it’s not a problem,” Angus replied. “I can see how it is, but I don’t care. I’m not going to change

“”“.....”put it on top of a broken home, or alcoholic parents, or bad crowds you get in with and you have trouble getting out of, you put it on top of not a lot of self-confidence, then you get a serious problem. And then Ritalin isn’t going to take away everything. It’s just going to take away the ADD, not relieve all these other problems you have.”

— —

.....”“Manageable,” I suggested. “Yeah, that’s it, so that I am more manageable for my teachers. I wouldn’t, ’cause that’s not me. If you can’t accept me for me, I think, then what are you looking for? What are you asking for from me?” I pressed the point a little: “But wouldn’t you like to be able to concentrate better, to be more focused in some of these other subjects besides just your favorite ones?” “”“.....”

In the ADD child, low self-esteem is manifested not just by the self-
putdowns he may utter, such as "I'm dumb." Above all, it is apparent in the perfectionism and in the dejection and discouragement he experiences when he fails at a task or loses in a game. Nor can he accept not being in the right. The fragile and self-rejecting ego is unable to endure any reminders of its fallibility. Many people with attention deficit disorder retain that fragility into adulthood.

The association between low self-esteem and attention deficit disorder is not that the first arises from the second, but that they both arise from the same sources: stress in the parenting environment and disrupted attunement/ attachment.

asked when they came in when as children they were lonely or in psychic pain, almost none recall feeling invited or safe enough to bare their souls to their parents. They kept their deepest griefs to themselves.

On the other hand, many recall being hyperaware of the parents' difficulties and struggles in the world, of not wanting to trouble them with their own petty and childish problems. The sensitive child, writes the Swiss psychotherapist Alice Miller, has "an amazing capacity to perceive and respond intuitively, that is unconsciously, to this need of the mother, or of both parents."¹

Acceptance of feelings, being out of touch with the emotional side puts a person out of touch with herself. What then remains to be esteemed? Only a false self, a concoction of what we would like to imagine ourselves to be and what we have divined others want us to be. Sooner or later, people come to realize that this false self—wanting what they think they should want, feeling what they think they should feel—does not work for them. When they look inside themselves, they discover a frightening emptiness, a vacuum, an absence of a true self or of intrinsic motivation. Many a time I have heard ADD

ADHD is a complex condition that affects millions of people. It is characterized by inattention, hyperactivity, and impulsivity. The symptoms can vary in severity and may change over time. It is important to seek professional help for a proper diagnosis and treatment. There are many resources available to help individuals with ADHD manage their symptoms and improve their quality of life.

If the child does not feel accepted unconditionally, he learns to work for acceptance and attention. When he is not doing this work, he feels anxious, owing to an unconscious fear of being cut off from the parent.

something specific, he has a vague unease, the feeling that he should somehow be working. The adult has no psychological rest because the infant and child had never known psychological rest. He has a dread of rejection and an insatiable need to have his desirability and value affirmed by others. Being wanted becomes a drug. Self-esteem is preempted by its false shadow, contingent self-esteem. What one does and what others think of it take precedence over who one is.

...stories of Lisa and David speak of something more painful than empathy and something less effective, too: they speak of identification. When a person empathizes, he can understand another's feelings and even share them, but he is conscious of himself as a separate individual, capable of taking independent and useful action. When he becomes identified, that boundary disappears. He reacts as if he was himself the victim. He feels the victim's humiliation, his helpless rage, his shame. This is not a state of adult human fellow feeling from which he can act

represents, in many situations, reactivated early memories stored in the implicit memory system, a vast and infallibly accurate record of past experiences. Implicit memory happens, according to the psychologist and memory researcher Daniel Schacter, “when people are influenced by a past experience without any awareness that they are remembering.”² Unconscious emotions and conscious feelings, rapid shifts in mood and dramatic physiological changes in the body can occur under the impact of implicit memory. [redacted]·[redacted]·[redacted]“[redacted] [redacted]”¹ [redacted]

if a sensitive child has unconscious or even preverbal experiences of feeling alone and cut off, misunderstood and shamed. From that arises a close identification with the powerless, with the underdog—the people Dostoevsky called “the insulted and the injured.”
